Low-Fidelity Prototype

For my low-fidelity prototype, I made changes from my previous design of a shopping cart page. The navigation bar stays consistent with the other pages, but I decided to create a separate box or background behind the product items that are in the cart, positioned on the left-hand side and under the "Shopping Cart" title. This places more emphasis on the cart items and allows the options in the cart seem more clickable. It is important to highlight the cart products more, especially when the order summary section, on the right-hand section, had this background layer in my previous design. The order summary section includes the subtotal and shipping price calculations, aligned with the cart section, so users can view or adjust product details and prices. Another change I added to the shopping cart page was a "Saved Items" section below the cart information. I realized that many existing web designs offered a list of items that the user saves, in order to easily view or add specific products to the current cart. This gives users more flexibility to finalize their shopping experiences by helping them view all product options available to purchase now or later.
